

Yangyang Chen is a Ph.D. candidate in the Department of Computer Science at Tsukuba University, Japan. She earned her master's degree from the Hunan University in China. Her research ambitiously spans across computer vision, natural language processing, the prediction of drug-target interactions, and computer-aided drug discovery (CADD). Throughout her doctoral journey, she has made significant contributions to the field, with numerous lead-authored publications in *Journal of Cheminformatics* and other journals. Her primary research emphasis lies in the generation and optimization of small molecule compounds and ligand design for protein targets using artificial intelligence (AI).
