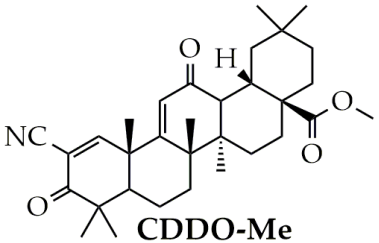
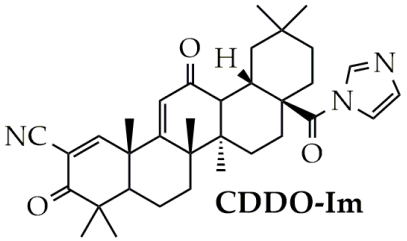
Cyano enone-bearing triterpenoids: high bioactivity, multitargeting, clinical trials

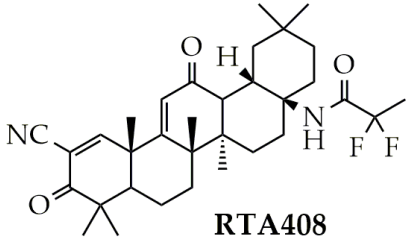
Triterpenoids developed by group of prof. Michael Sporn (Geisel School of Medicine at Dartmouth, USA). Clinical trials by Reata Pharmaceuticals, Inc.



CDDO-Me
(Bardoxolone methyl)

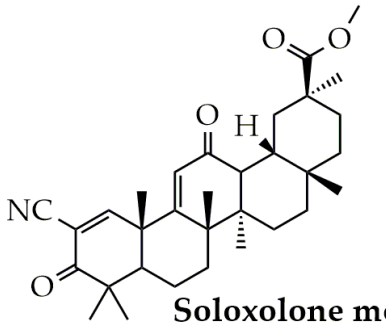


CDDO-Im

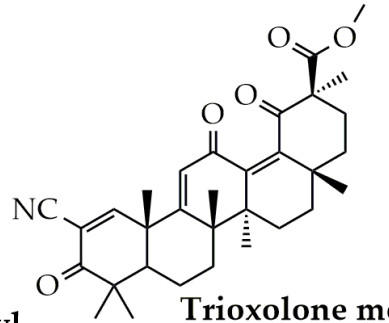


RTA408

Glycyrrhetinic acid-based analogs of CDDO-Me synthesized in the Laboratory of pharmacologically active compounds, NIOCH SB RAS



Soloxolone methyl
(SM)



Trioxolone methyl
(TM)

- Induce of apoptosis of tumor cells (*Logashenko et al., ChemBioChem, 2011*);
- Suppress tumor growth *in vivo* (*Markov et al. Mol. Biol., 2018*);
- Trigger ER stress (*Markov et al. Oncotarget, 2019*);
- Inhibit acute inflammation *in vivo* (*Markov et al. Mol. Biol., 2018*);
- Inhibit peritonitis progression in mice (*Markov et al., Int. J. Mol. Sci., 2020*);
- Ameliorate DSS-induced colitis in mice (*Markov et al., Molecules, 2020*)
- Inhibit acute lung injury in mice (*Sen'kova et al. PLOS One, 2021*)

Clinical trials:

- solid tumors and lymphoid malignancies (Phase 1);
- chronic kidney disease (Phase 3);
- pulmonary hypertension (Phase 3);
- Alport Syndrome (Phase 2/3);
- COVID-19 (Phase 2/3)

Are these compounds able to block the aggressiveness of glioblastoma multiforme?

The aim of the study

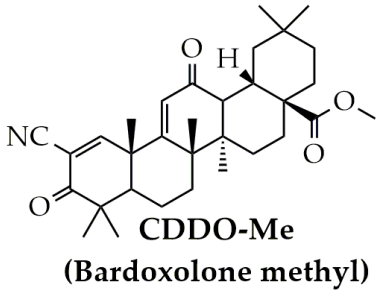
To determine whether cyanoenone-containing pentacyclic triterpenoids can block glioblastoma multiforme aggressiveness

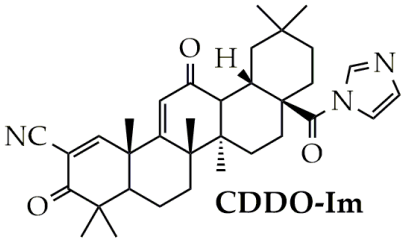
Main tasks:

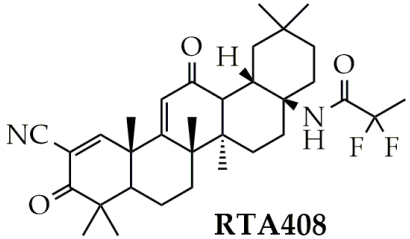
- Synthesis of novel amides of soloxolone
- Evaluation of permeability of novel soloxolone amides through blood-brain barrier
- Evaluation of cytotoxicity of novel compounds against glioblastoma cells
- The study of mechanisms underlying the cytotoxic activity of hit compound
- Exploration of the effect of hit compound on pro-metastatic characteristics of glioblastoma cells
- Evaluation of the effect of novel soloxolone amides on glial-mesenchymal transition in glioblastoma cells
- Verification of anti-glioblastoma potency of hit compound in animal model

Cyano enone-bearing triterpenoids: high bioactivity, multitargeting, clinical trials

Triterpenoids developed by group of prof. Michael Sporn (Geisel School of Medicine at Dartmouth, USA). Clinical trials by Reata Pharmaceuticals, Inc.



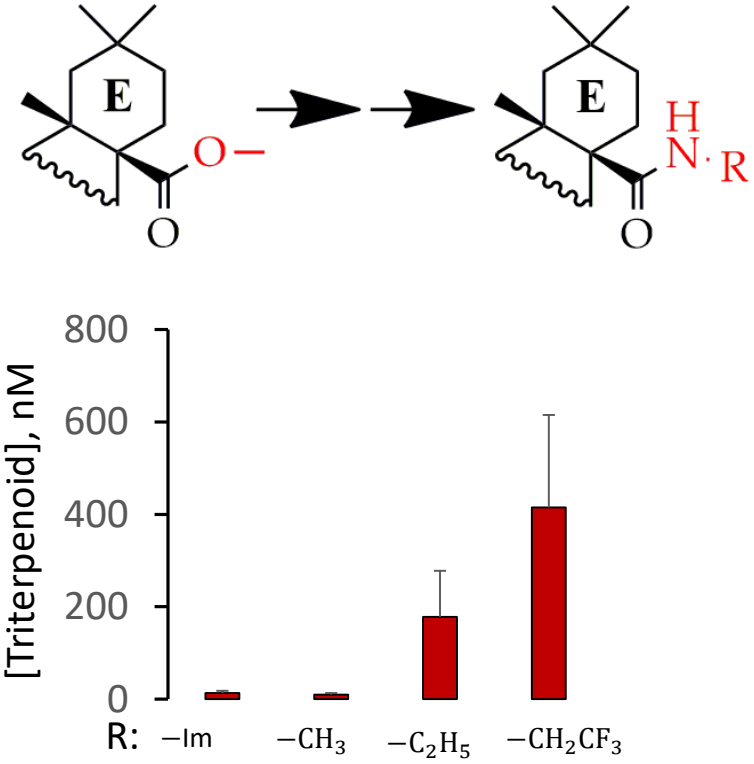




Clinical trials:

- solid tumors and lymphoid malignancies (Phase 1);
- chronic kidney disease (Phase 3);
- pulmonary hypertension (Phase 3);
- Alport Syndrome (Phase 2/3);
- COVID-19 (Phase 2/3)

Formation of an amide group at position C-29 enhances the accumulation efficiency of cyano enone-containing triterpenoids in mouse brain



Sporn et al. US patent No. 12/151,425, 2009

Are these compounds able to block the aggressiveness of glioblastoma multiforme?

Novel soloxolone amides. Cytotoxicity

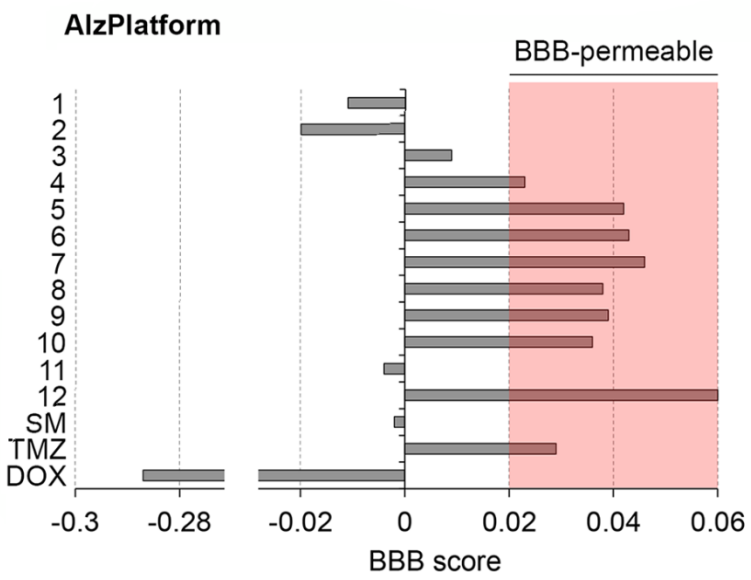
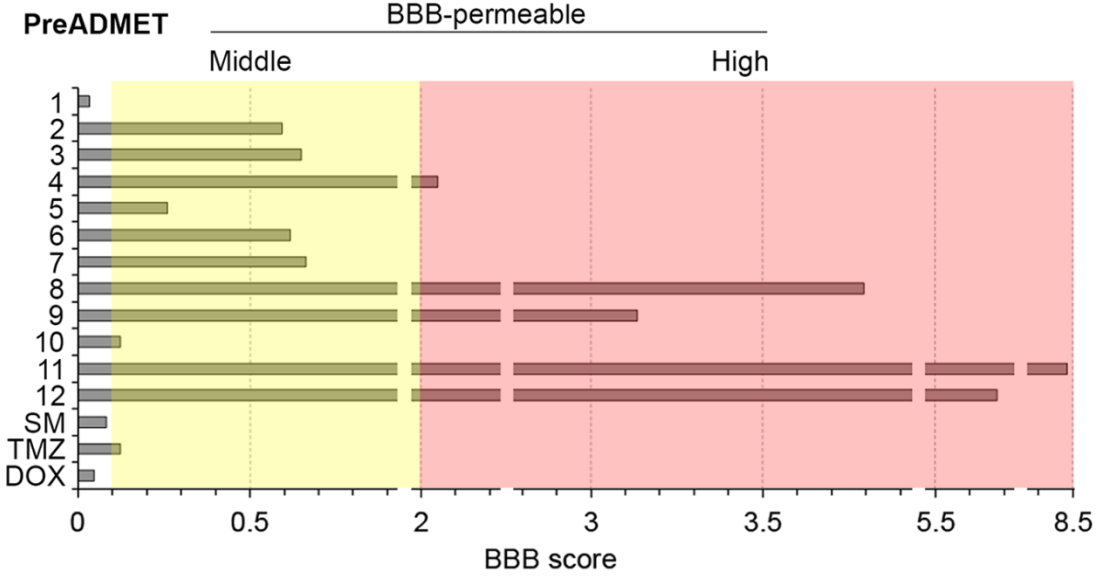
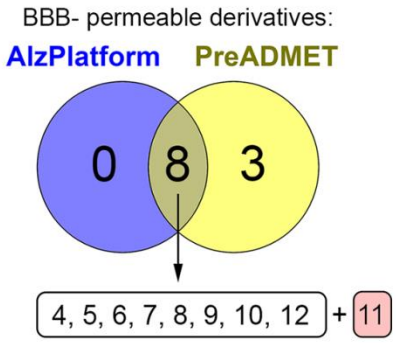
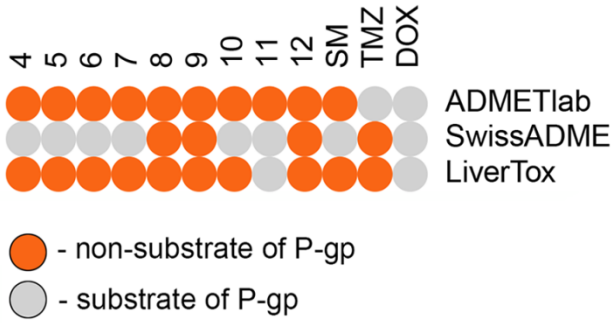
HeLa – human cervical carcinoma;
HuTu-80 – human duodenal adenocarcinoma;
B16 – murine melanoma;
hFF3 – non-malignant fibroblasts

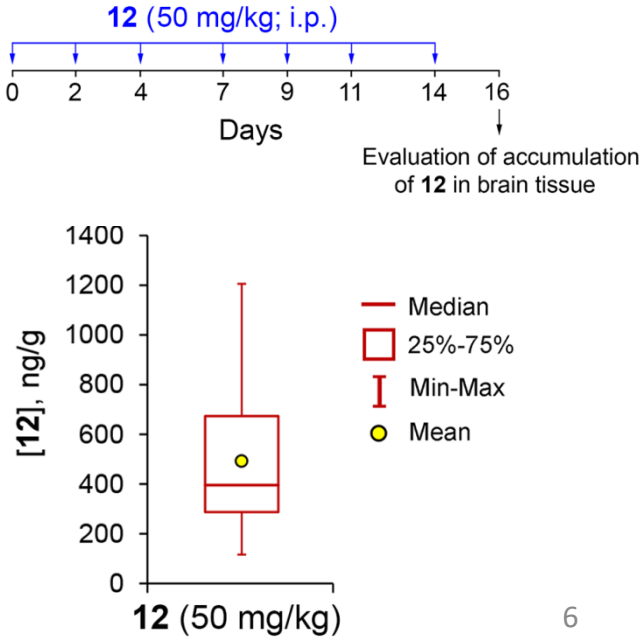
Soloxolone amides are capable to cross the blood-brain barrier







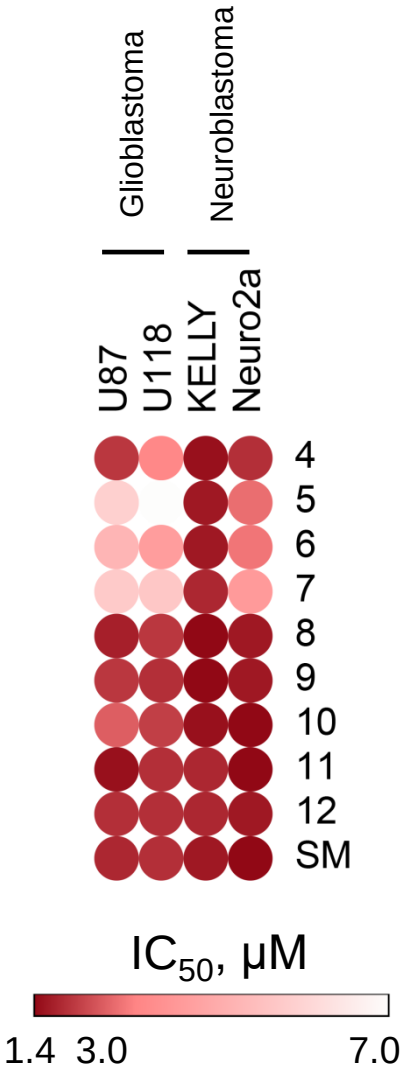




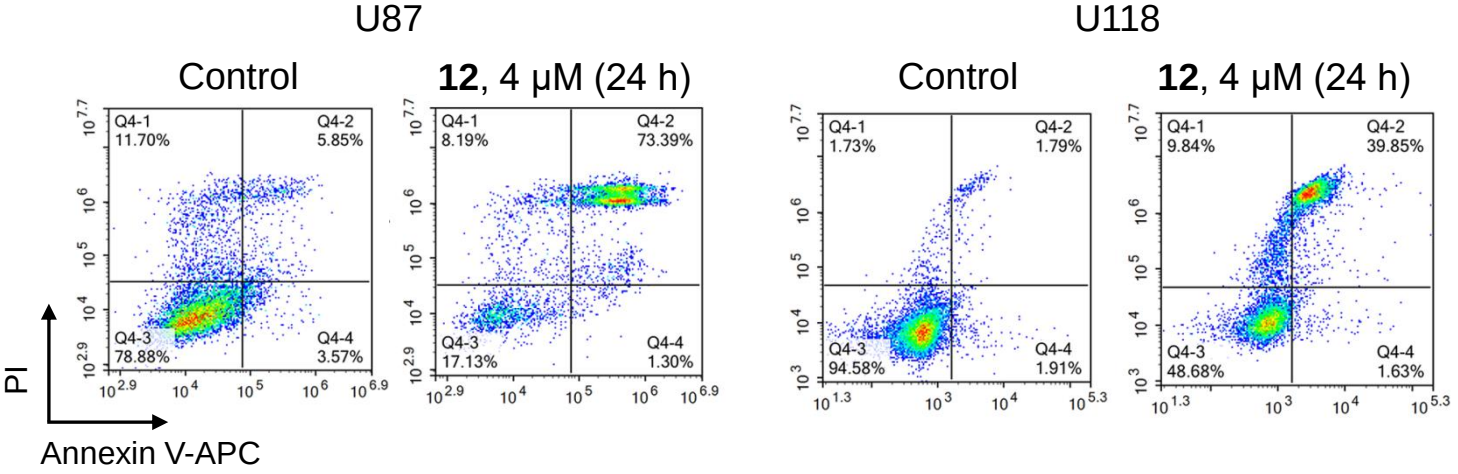
The content of compound **12** in mouse brain tissue was determined by HPLC-MS/MS

Novel soloxolone amides trigger apoptosis in glioblastoma cells

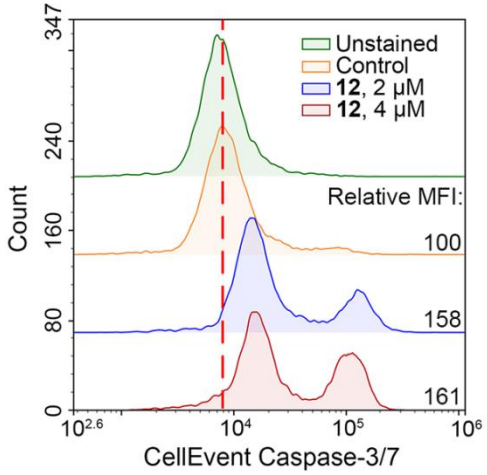
Cytotoxicity of compounds against tumor cells of glial and neuronal origin



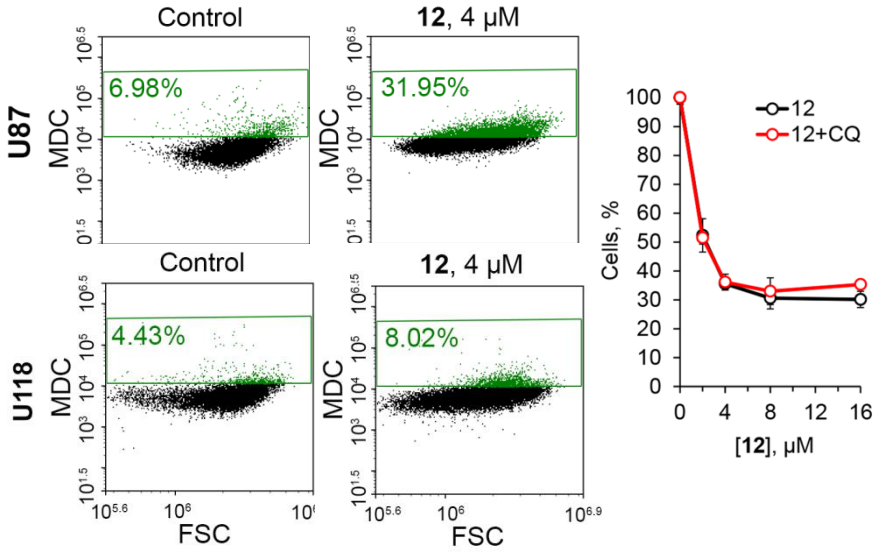
***12** induces phosphatidylserine externalization*



***12** activates caspases-3/-7*

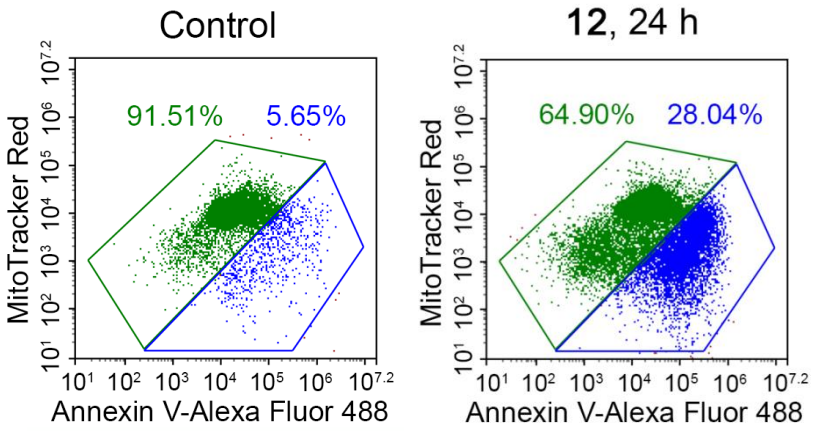


***12** triggers autophagy in U87 cells*

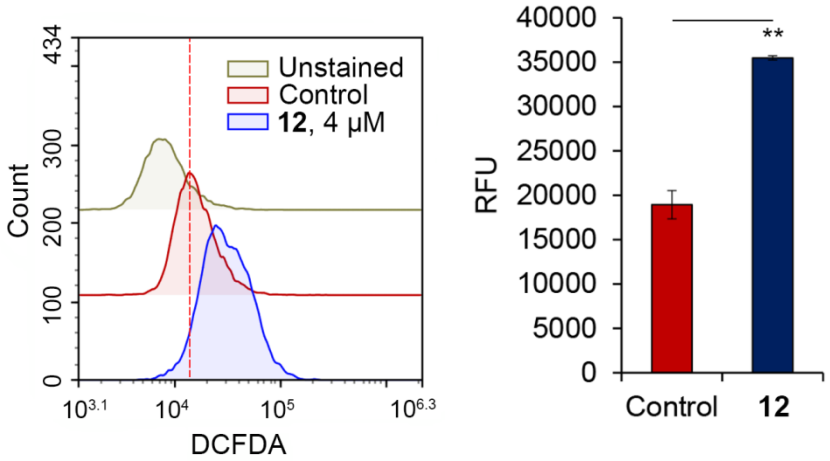


Compound 12 activates mitochondrial pathway of apoptosis in glioblastoma cells

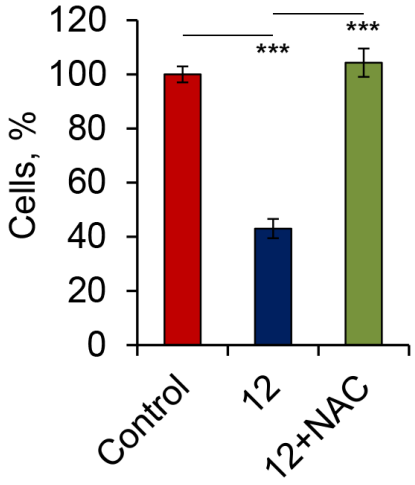
12 *triggers dissipation of mitochondrial membrane potential of U87 cells*



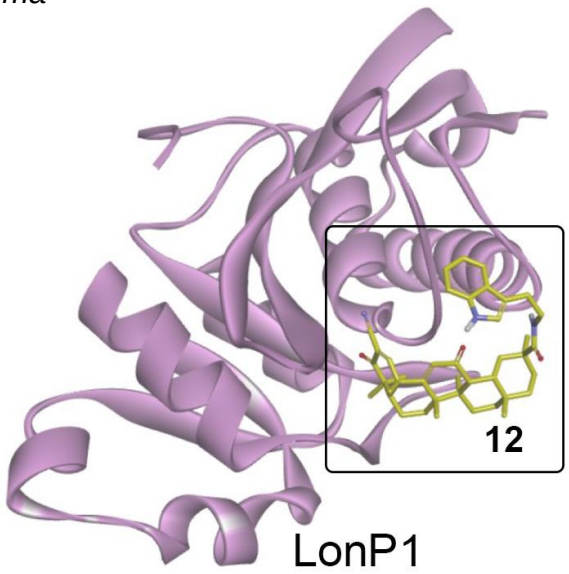
12 *stimulates ROS generation in U87 cells*

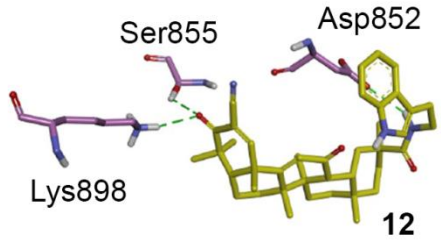


12 *induced ROS-dependent death of glioblastoma cells*



Mitochondrial LonP1 protease is probable primary protein target of ***12*** *associated with its cytotoxicity*

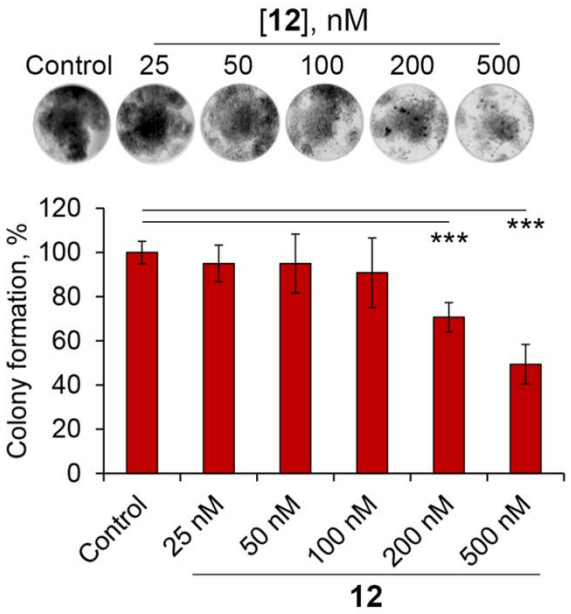




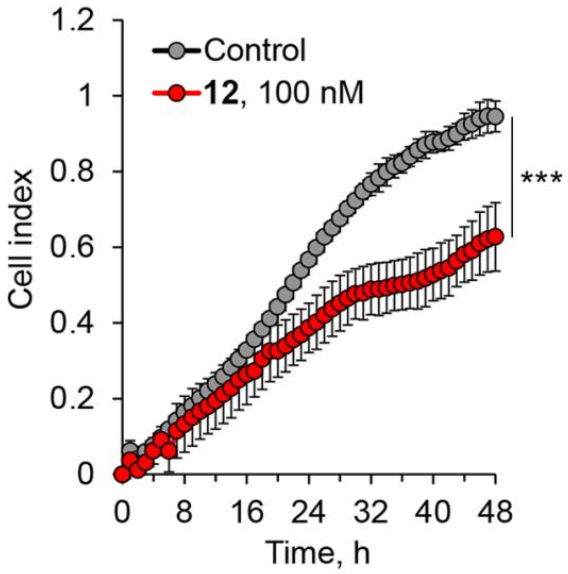
ΔG = -8.8 kcal/mol

Compound 12 demonstrates high anti-glioblastoma potency at non-toxic concentrations

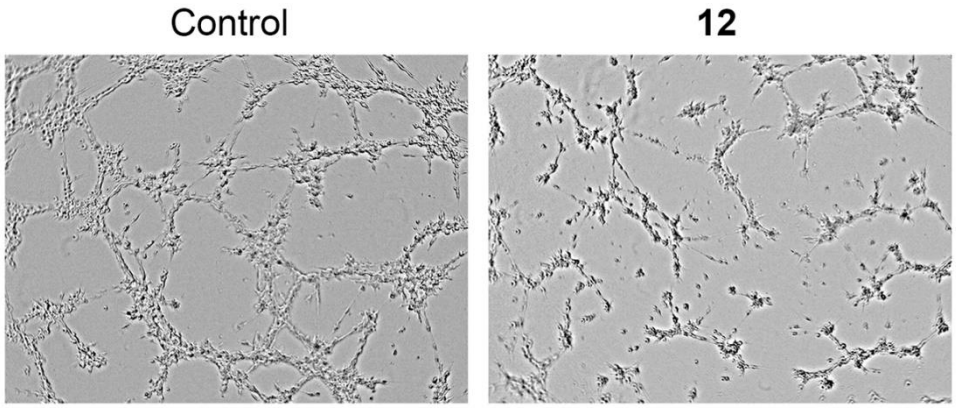
12 *inhibits clonogenicity of U118 cells*

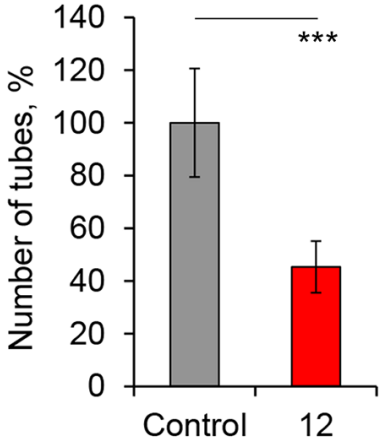


12 *inhibits motility of U118 cells*

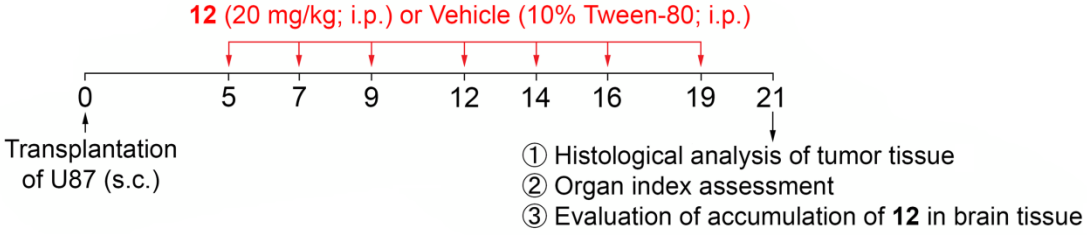


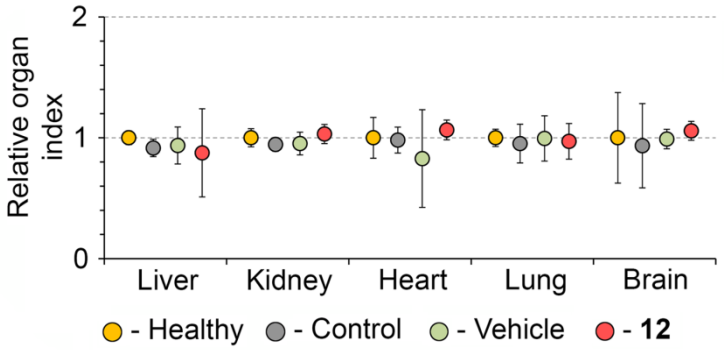
12 *suppresses glioblastoma vasculogenic mimicry (U87 cells)*

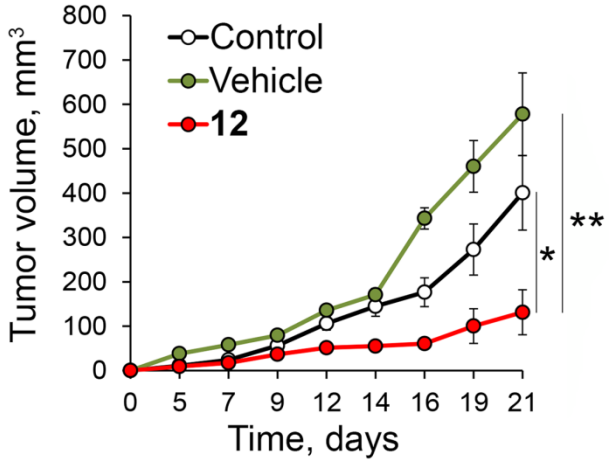


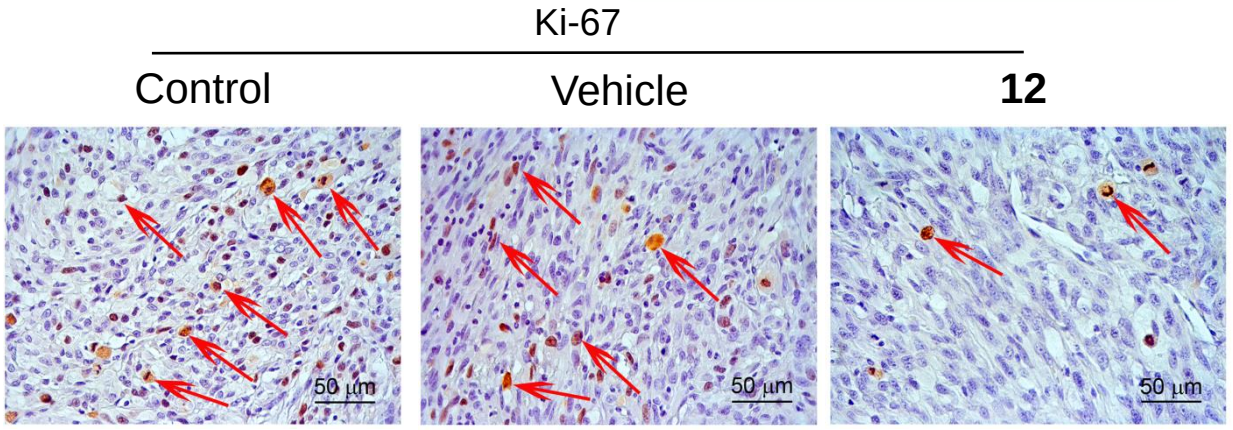


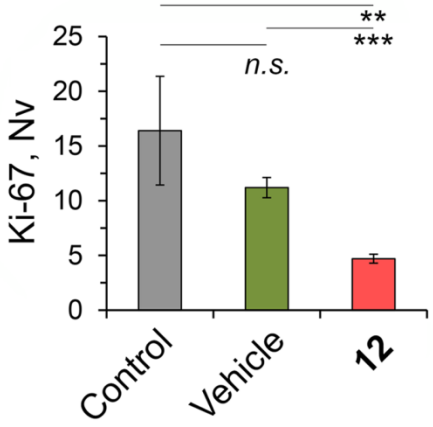
Compound 12 effectively blocks growth of U87 glioblastoma in xenograft model *in vivo*

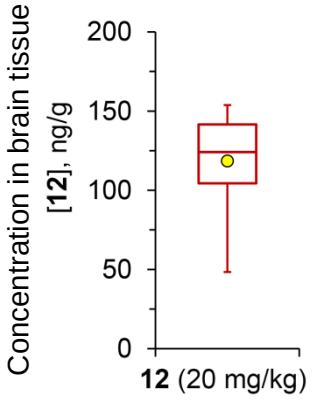












EGFR, AKT1, and ERBB2 are probable primary targets of compound 12 associated with its anti-glioblastoma potency

Probable target prediction:

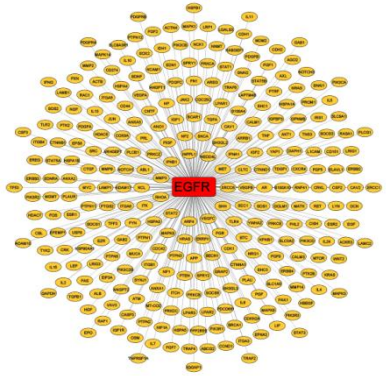
Reconstruction of gene association networks

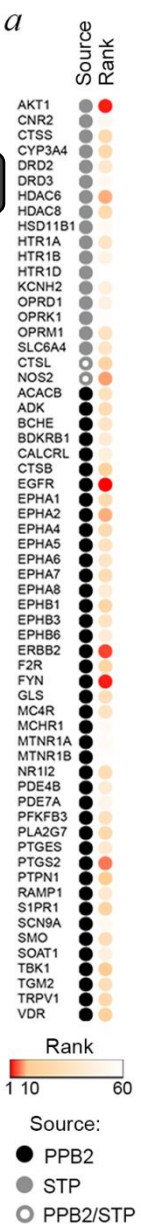


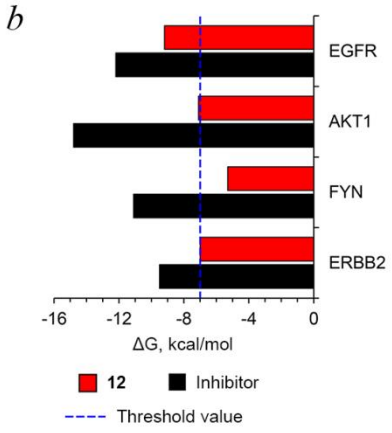
GBM pathogenesis
DisGeNET ID: C1621958

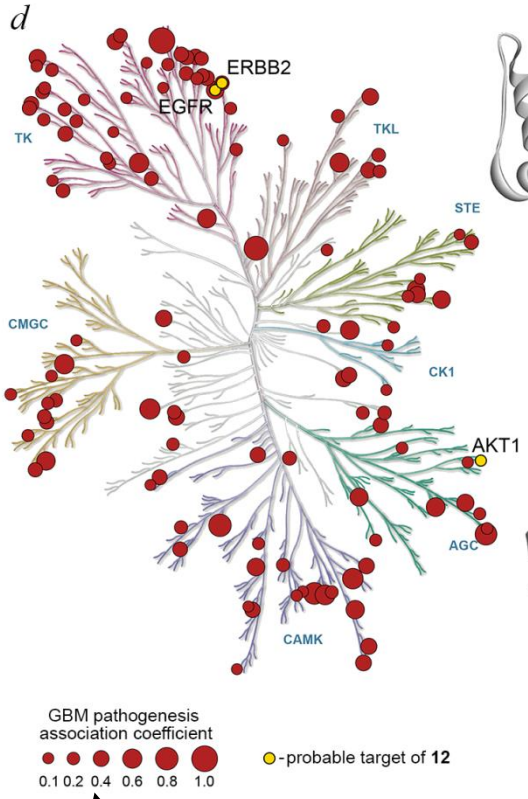
Calculation of target's centrality score:

- Degree
- MCC
- Betweenness

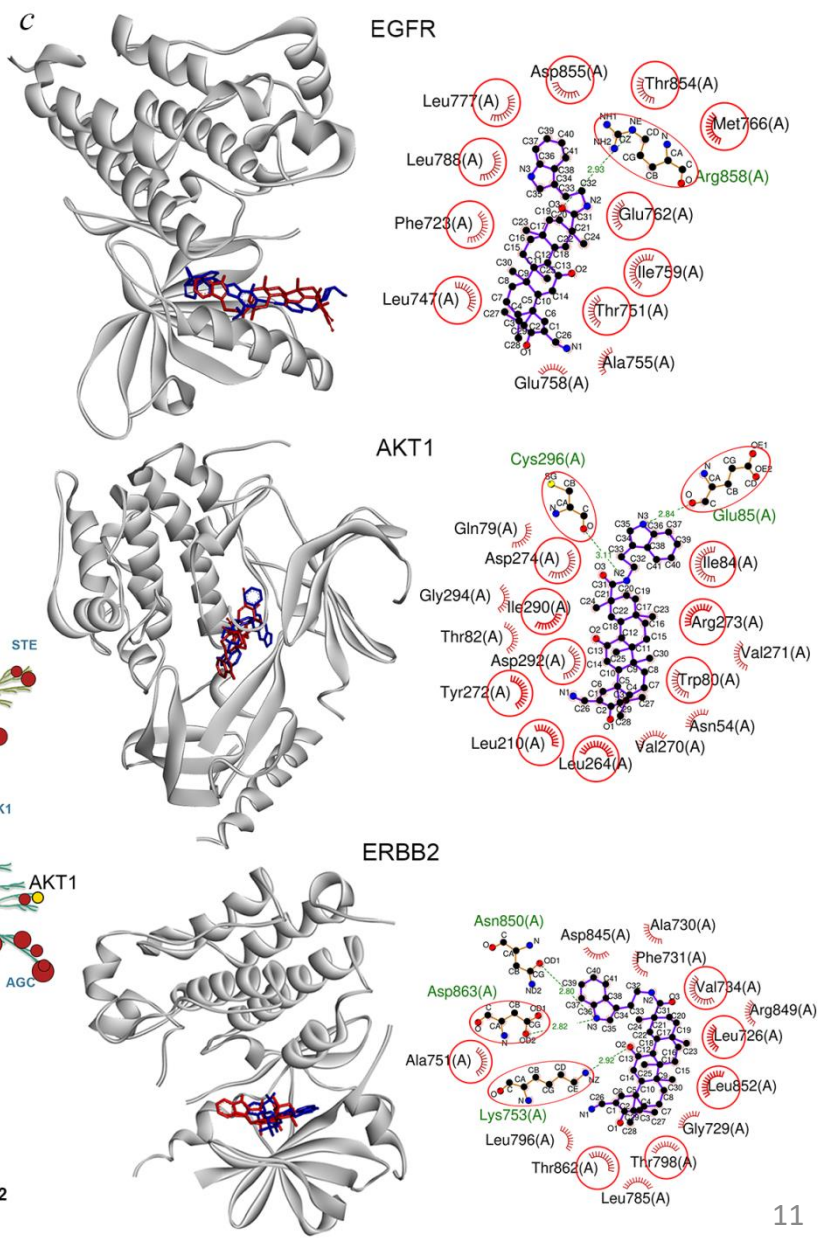
Ranking





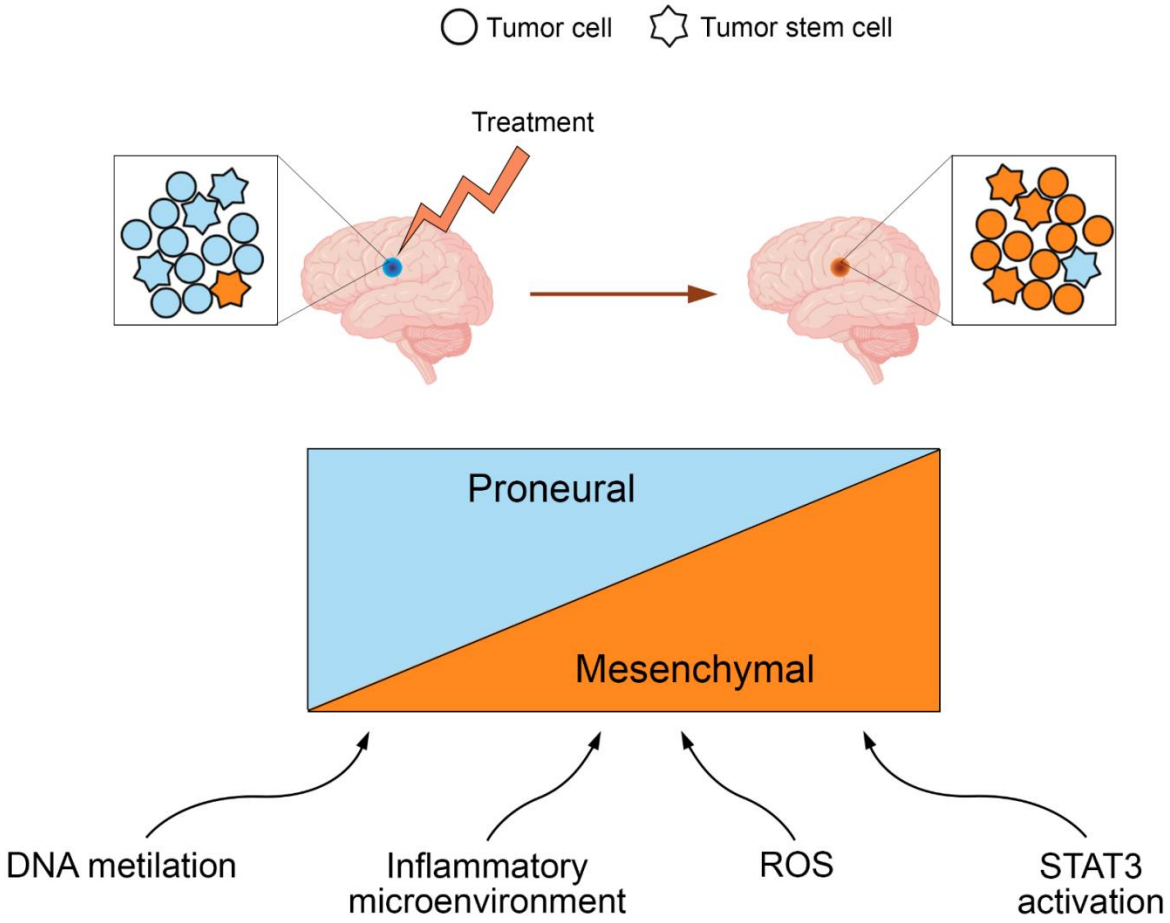


OpenTargets platform data



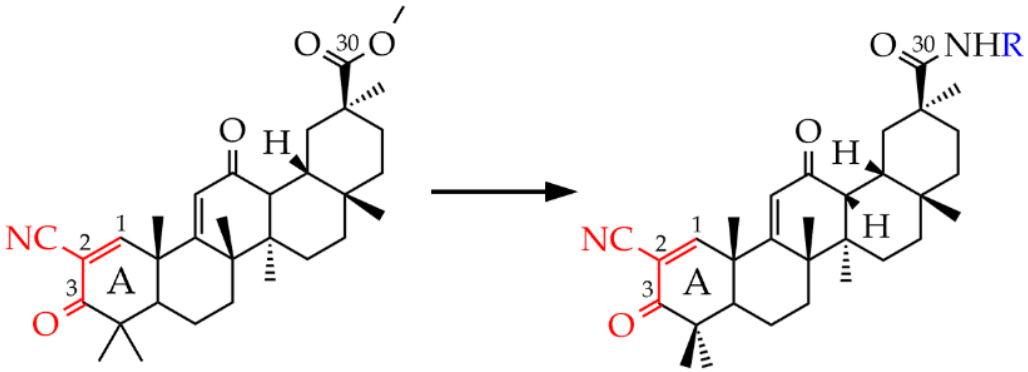
Glial-mesenchymal transition is a key process underlying high aggressiveness of GBM

- There are 4 molecular subtypes of GBM: classical, neuronal, proneural, and mesenchymal. Mesenchymal is the most malignant and is associated with the worst prognosis.
- A shift toward a mesenchymal phenotype, or **glial-mesenchymal transition (GMT)**, occurs during glioblastoma progression due to accumulated mutations and tumor microenvironment factors.
- The glial stem cell population is highly resistant to radio- and chemotherapy - these cells restore tumor growth, giving rise to recurrence.



Fedele et al., 2019; Setlai et al., 2022

Soloxolone amides capable of crossing the blood-brain barrier

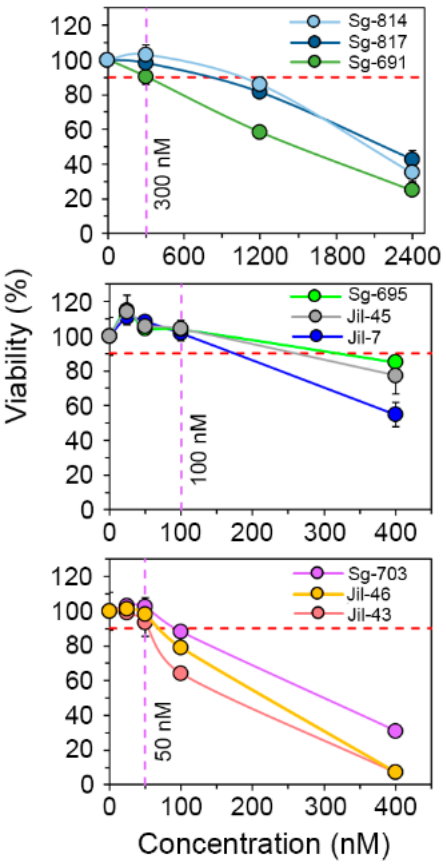


Soloxolone methyl

Soloxolone amides

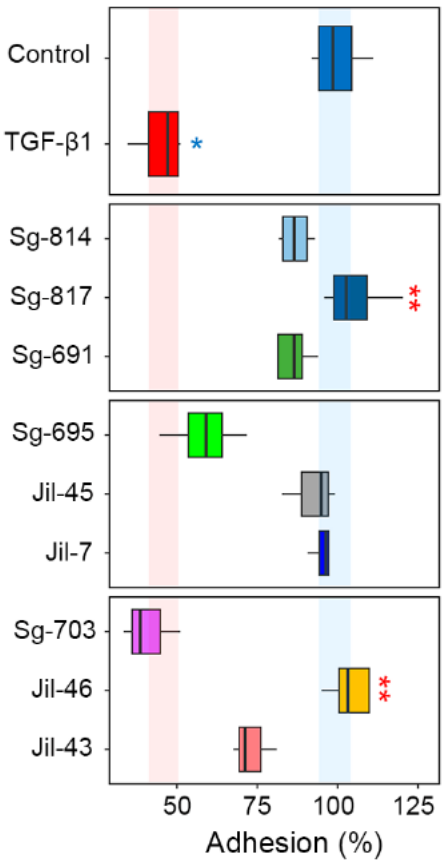
Soloxolone amides effectively suppress processes associated with TGF-β1-induced GMT in U87 cells

Identification of non-toxic concentrations



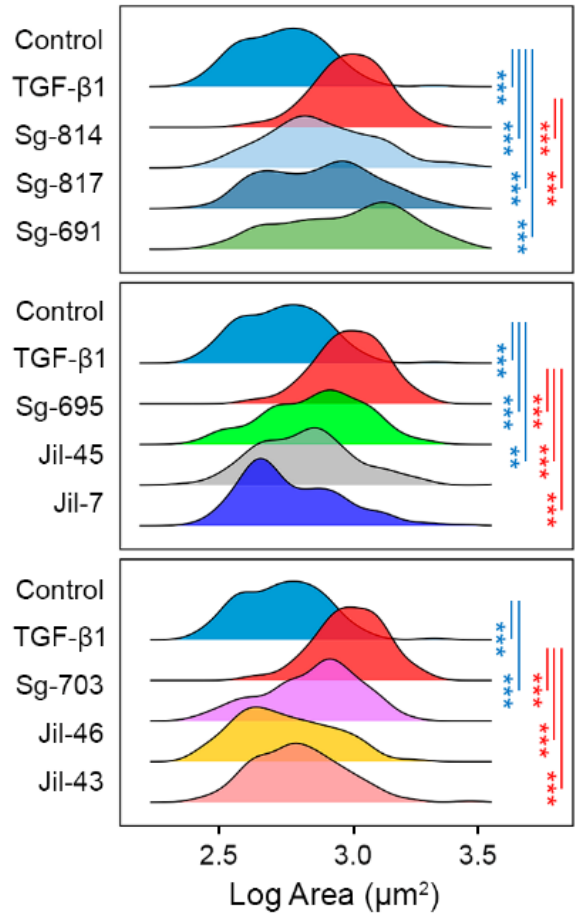
MTT assay data (48 h)

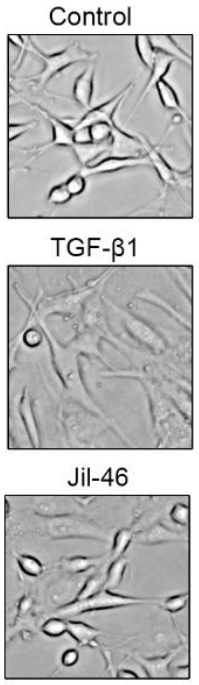
The effect of compounds on cell adhesion



Trypsin test (48 h)

The effect of compounds on cell morphology



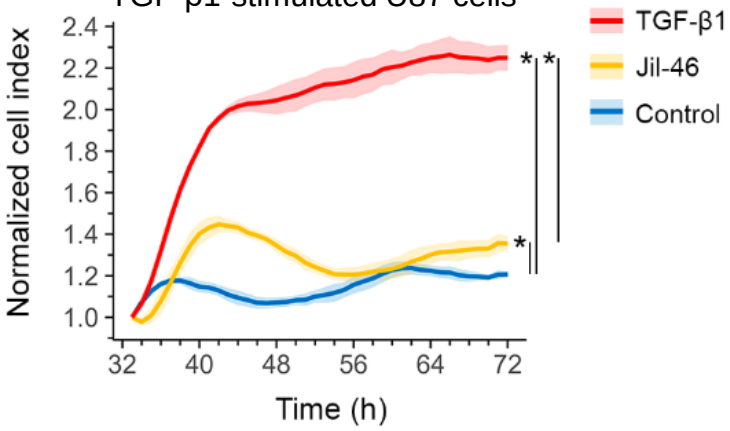


* - p-value < 0.05, ** - p-value < 0.01,
*** - p-value < 0.001

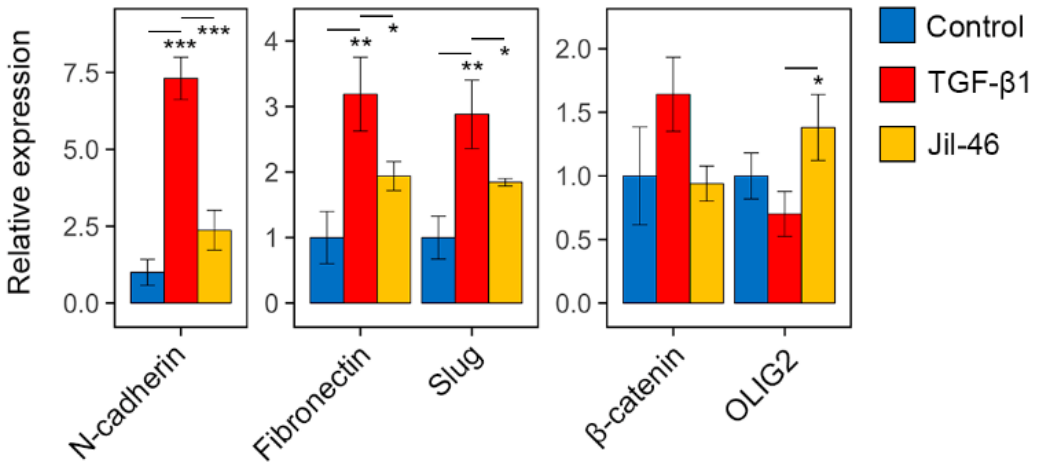
Hit compound: Jil-46

Jil-46 blocks TGF-β1-induced GMT in U87 cells

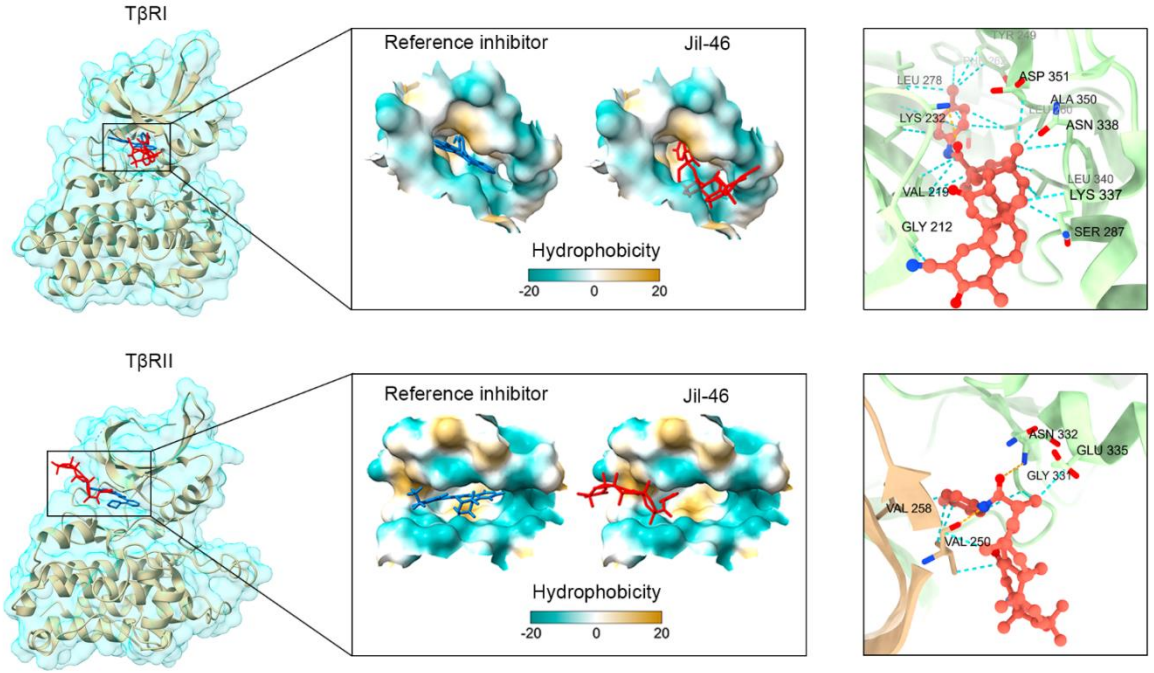
Jil-46 inhibits transwell-migration of TGF-β1-stimulated U87 cells

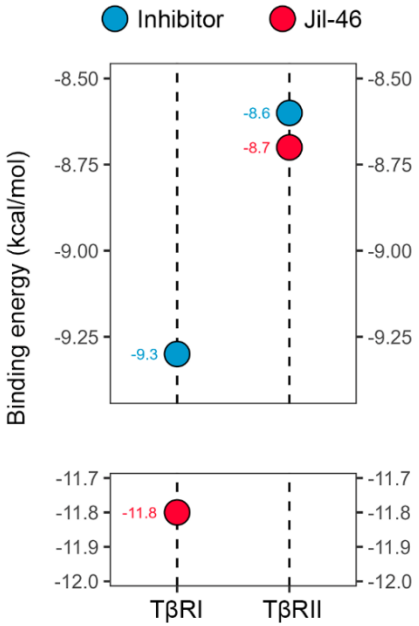


The effect of Jil-46 on key markers of GMT

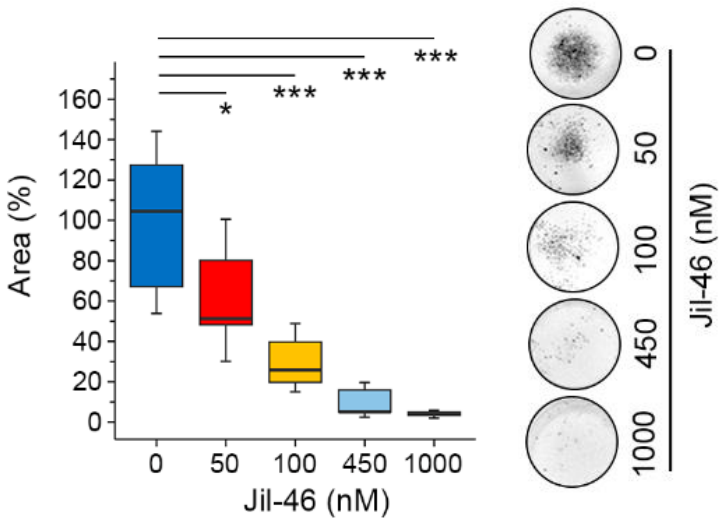


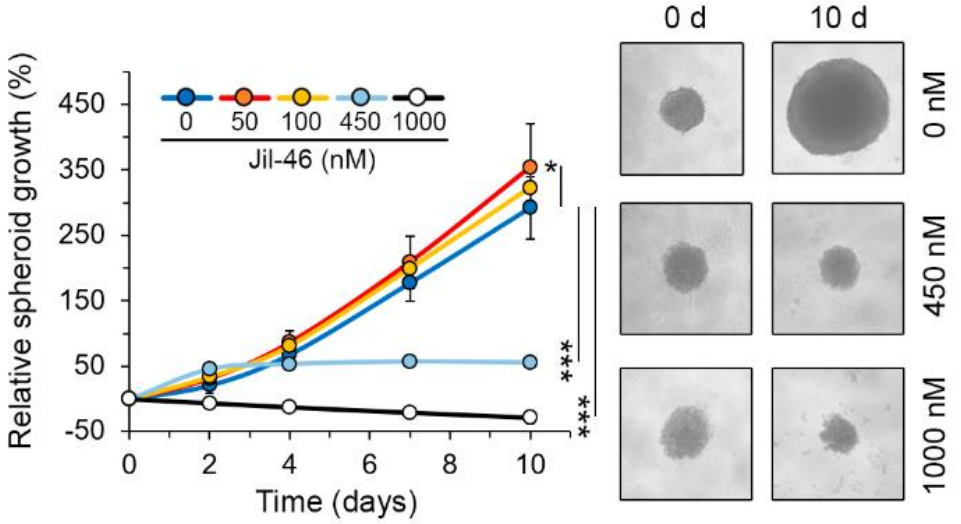
Jil-46 can bind to the active sites of TGF-β type I and type II receptors



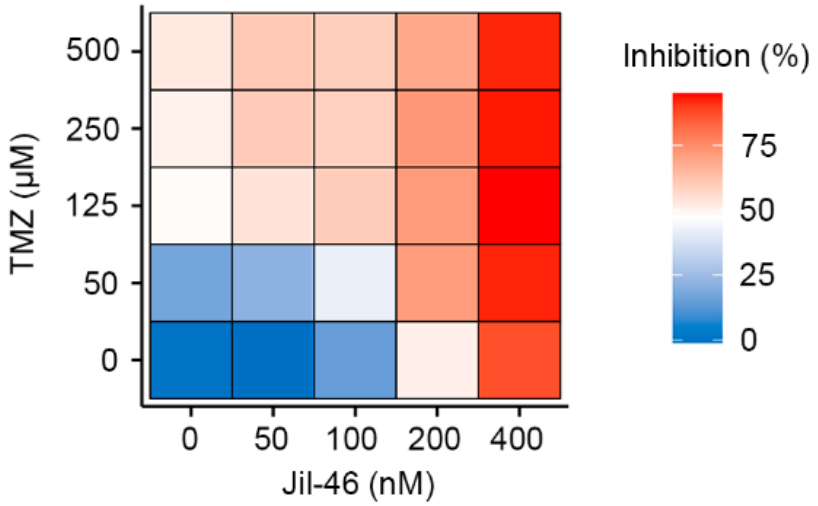


Jil-46 inhibits clonogenicity and spheroid growth of U87 cells

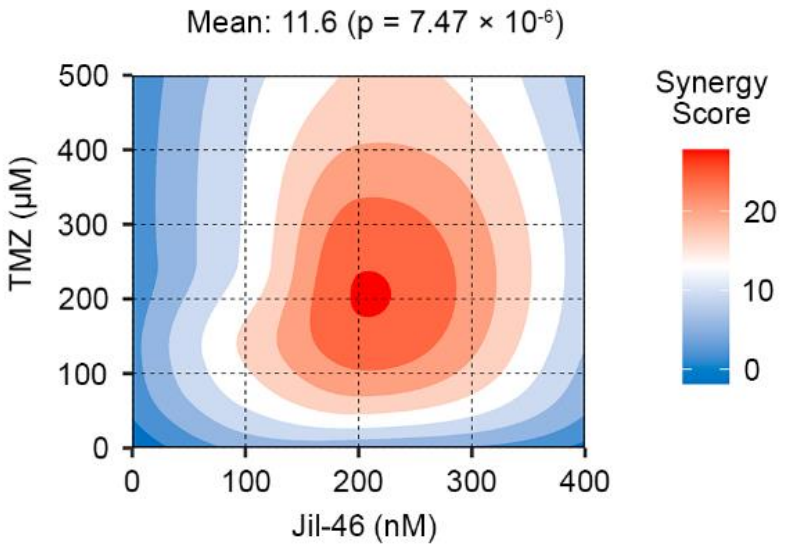




Jil-46 has a synergistic effect with temozolomide on U87 cell viability.

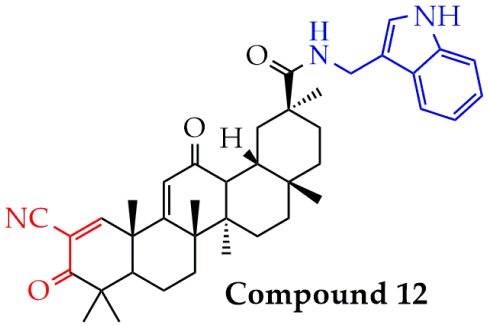


MTT assay data (72 h)



The synergy score was determined using SynergyFinder Plus

Cyanoenone-bearing triterpenoids are promising drug candidates for glioblastoma treatment



Compound 12

- Successfully permeable through BBB
- Toxic concentrations (glioblastoma):
  - ↑ ROS-dependent cell death
  - Probable direct interaction with LonP1
  - ↑ Mitochondrial apoptosis
- Non-toxic concentrations (glioblastoma):
  - ↓ Clonogenic activity
  - ↓ Cell motility
  - ↓ Vasculogenic mimicry
- ↓ Growth of U87 glioblastoma in vivo
  - ↓ Tumor volume and weight
  - ↓ Ki67-positive cells
- Probable protein targets
  - LonP1
  - EGFR
  - ERBB2
  - AKT1

Jil-46

- TGF-β1-stimulated GBM cells
  - ↑ Cell adhesion
  - ↓ Cell spreading
  - ↓ Cell motility
  - ↓ Expression of mesenchymal markers
  - ↑ Expression of glial marker OLIG2
- GBM cells
  - ↓ Clonogenic activity
  - ↓ Spheroid growth
  - ↑ Synergistic effect with TMZ
- Probable protein targets
  - TβRI
  - TβRII
